

Inspect the red stuff

CMake have now parsed all CMakeLists.txt files and inspected your system/ computer. The red stuff is what it found in first iteration. Look stuff over to see if it is correct and fix the things you do not like.

Click Configure (2nd Time)

Now all red stuff should have gone unless you have a conflict or error that CMake do not know how to resolve for your system. If you still got red stuff at this point, then fix it and re-run configure until all red stuff has gone.
